

Roof Top Concealments

Would a concealed site blend into the current cityscape?

Will a concealment protect a small town's charm?

In metropolitan and suburban areas alike, taking full advantage of the height of existing buildings is worth considering. In many cases, topping a structure with a box or penthouse style concealment is an excellent option.

Choose a roof top or side mounted concealment to blend seamlessly with your existing building – or opt to add an eye-catching architectural design element. Simulated brick, block, stucco and stone textures can be hand-painted to match an existing building's façade. Or add visual drama with a signal-friendly enhancement like a steeple, louvered penthouse or cupola.

Though a flagpole or tree may seem like a great quick fix, a roof top solution may actually be equally as fast...or even faster! And, advance planning for expanded capacity – to conceal multiple antennas on a roof top or building side – may be your most economical choice for the long haul. Flexibility to incorporate additional carriers or retrofit with new technology at a later date adds to the long-term value of a roof top style concealment. Plus, easy access to an existing building's roof can translate to accelerated installation schedules and less site prep, followed by low cost post-installation serviceability.

Site selection experts evaluate opportunities in the targeted site area and will help to determine whether a building meets the criteria to host a rooftop concealment like an aesthetically pleasing typical mounted box or chimney – or whether a side mounted box is a better choice. Side mounted boxes are similar animals to roof top concealments – in terms of potential capacity, construction and site prep.

Remember...regardless of the transmission site, concealed or not, the future may hold unanticipated surprises. In developing areas, construction of tall structures could inhibit signal transmission, forcing relocation, redirection, or the addition of rooftop mounted transmission equipment. When that happens, wireless carriers, site experts and STEALTH® will team up to provide the next signal transmission solution.
